

The GateKeeper Proximity Difference

PROXIMITY LOCK AND UNLOCK

Login and out seamlessly with your presence.

GATEKEEPER PROXIMITY

FACIAL RECOGNITION

Save time while logging in

GateKeeper continues to search for nearby PCs to log users in instantly without scanning for facial recognition.

False negatives

Prone to errors and failures when face has dirt, debris. Reported inaccuracies based on similar physical traits (e.g. twins).

Contactless login

Keep your face masks on and log in without contact. Frictionless login and logout based on your simple presence.

Not PPE-friendly

Have to remove face masks and goggles to scan. Shouldn't have to choose between security and convenience.

Privacy-friendly

GateKeeper allows IT admins to grant and revoke access instantly without needing personal biometric information.

Once your face is hacked, it's forever

Unlike passwords, you can't change your face hash ID once it's been hacked. If your face is exposed, it's forever.

Self-register from home

During these times, it's important to save IT admins time by letting users self-register their keys from home.

Requires in-person registration

Every employee has to come to the IT/HR office to get their face/iris registered. This is unfeasible during COVID.

Lower cost of ownership

Users of GateKeeper generally earn back their investment within 2 to 3 months. Removing password problems saves money.

Prohibitively expensive

The costs associated with physical scanners, maintenance, and licensing are some of the highest costs in authentication.

GateKeeper Proximity is PPE-friendly and doesn't interrupt the user's workflow. Experience fast and secure login at a fraction of the cost.
